

RF Ablation Access and Opportunity Analysis

Objective:

To assess **rural vs. urban disparities** in access to radiofrequency ablation (RFA) treatments for chronic back pain, and identify **high-opportunity ZIP codes and states** where Nevada RFs **remote activation model** can close access gaps.

Source:

CMS Medicare Physician and Other Practitioners by Provider and Service Dataset

Covers **100% of Medicare Part B Fee-for-Service (FFS)** claims

Provider (NPI) × CPT/HCPCS Code × Place of Service

Includes: Procedure volume, Medicare payments, patient count, provider ZIP code, provider specialty

CMS Physician and Other Practitioners by Provider and Service Dataset

- Provides one row per provider + CPT code + place of service.
- Includes exact HCPCS (CPT) codes, allowing for precise filtering.
- Used in this project to extract only RFA-related CPT codes, based on Abbott's Reimbursement Coding Guide.

Using [Abbott's RF Ablation Reimbursement Guide](#), we focused on CPT codes that reflect **RFA procedures** only:

CPT Code	Region	Description
64633, 64634	Cervical/Thoracic	First and additional facet joints
64635, 64636	Lumbar/Sacral	First and additional facet joints
64625	SI Joint	Sacroiliac nerve ablation

64624	Genicular nerve	Knee/Peripheral application
64640	Other nerves	General peripheral RF
77002	Fluoroscopic support	Imaging guidance (not therapeutic)

Assumptions:

1. **Only fee-for-service Medicare patients** are included (It excludes people with private insurance, military coverage (Tricare), or Medicare Advantage.).
2. The **RUCA classification** from ZIP codes helps identify rural vs. urban provider distribution.
3. Rural areas might look like they have fewer services because small numbers are hidden as a service provided to 10 or fewer patients is hidden to protect privacy.

Rural ZIPs are underrepresented in the dataset (only ~0.5% of ZIP entries are rural).

4. Payments can vary because of: Location (e.g., rural vs. urban costs), Extra notes on claims (like "modifiers" that change how a service is billed), Multiple procedures done in one visit (discounts may apply).
5. The dataset shows costs and how often services are used, but it doesn't tell you if the care was good or bad.
6. No Adjustment for Patient Sickness: The data doesn't account for how sick patients are, though it gives average "risk scores" to guess their health status.
7. Confusing Provider Billing: Some doctors bill under both personal and clinic IDs, making it hard to track their total work.

Facility Payments: For hospital services, the data only shows the doctor's fee, not the hospital's charge. **Exception: Ambulatory Surgery Centers (ASCs) show both fees.**

Results:

Tot_Benes: Total number of Medicare patients who received the service.

Tot_Srvcs: Total number of times the service was provided (counts all claims).

Tot_Bene_Day_Srvcs: Unique services per patient per day (avoids counting duplicates for the same day).

Avg_Mdcr_Stdzd_Amt: Average payment Medicare made for the service, adjusted to remove regional cost differences.

Rndrng_NPI: Unique ID number assigned to the doctor or clinic providing the service.

Rndrng_Privr_RUCA_Desc: Whether the provider is in an urban or rural area (e.g., "Metropolitan Area").

HCPCS_Cd: Code for the specific medical service (e.g., "64633" = radiofrequency ablation).

HCPCS_Drug_Ind: Indicates if the service involves a drug (Yes/No).

Place_Of_Srvc: Where the service happened – F (hospital/facility) or O (clinic/non-facility).

Facility (Place_Of_Srvc = 'F')

Hospitals (inpatient or outpatient departments), Ambulatory Surgical Centers (ASCs), Skilled Nursing Facilities (SNFs), Rural Health Clinics.

Payment Structure: Medicare splits payments into two parts:

Professional Fee: Paid to the physician for their services.

Facility Fee: Paid to the institution for overhead costs (e.g., equipment, staff, utilities).

Exception: For ASCs, the dataset includes both fees (unlike other facilities).

Non-Facility (Place_Of_Srvc = 'O')

Physician offices, Freestanding clinics, Home visits.

Payment Structure: Medicare pays a single bundled amount covering both the physician's work and facility costs.

Non-facility settings are more common in rural areas (e.g., small clinics).

Payments are standardized and often lower than facility rates.

Categorization of Urban and Rural:

Metropolitan area core: primary flow within an urbanized area of 50,000 and greater: Urban

Micropolitan area core: primary flow within an urban cluster of 10,000 to 49,999: Urban

Secondary flow 30% to <50% to a larger urbanized area of 50,000 and greater: Urban

Metropolitan area high commuting: primary flow 30% or more to a urbanized area of 50,000 and greater: Urban

Metropolitan area low commuting: primary flow 10% to <30% to a urbanized area of 50,000 and greater: Urban

Metropolitan area low commuting: primary flow 10% to <30% to a urbanized area of 50,000 and greater: Urban

Secondary flow 30% to <50% to a larger urbanized area of 50,000 and greater: Urban

Secondary flow 30% to <50% to a urban cluster of 10,000 to 49,999: Urban

Micropolitan high commuting: primary flow 30% or more to a urban cluster of 10,000 to 49,999: Rural

Small town core: primary flow within an urban cluster of 2,500 to 9,999: Rural

Rural areas: primary flow to a tract outside a urbanized area of 50,000 and greater or UC: Rural

Small town low commuting: primary flow 10% to <30% to a urban cluster of 2,500 to 9,999: Rural

Small town high commuting: primary flow 30% or more to a urban cluster of 2,500 to 9,999: Rural

Micropolitan low commuting: primary flow 10% to <30% to a urban cluster of 10,000 to 49,999: Rural

Metrics Used:

Column	Meaning
Total_Services	Sum of all RFA procedure claims (Tot_Srvcs) submitted in that place of service and RUCA region.
Total_Beneficiaries	Total number of unique Medicare Fee-For-Service patients (Tot_Benes) treated.
Total_Beneficiary_Days	Represents total visit-days or treatment sessions (Tot_Bene_Day_Srvcs). Useful for evaluating repeated services.

Unique_Providers

Count of distinct rendering NPIs (providers) performing RFA procedures in the grouped geography/service setting.

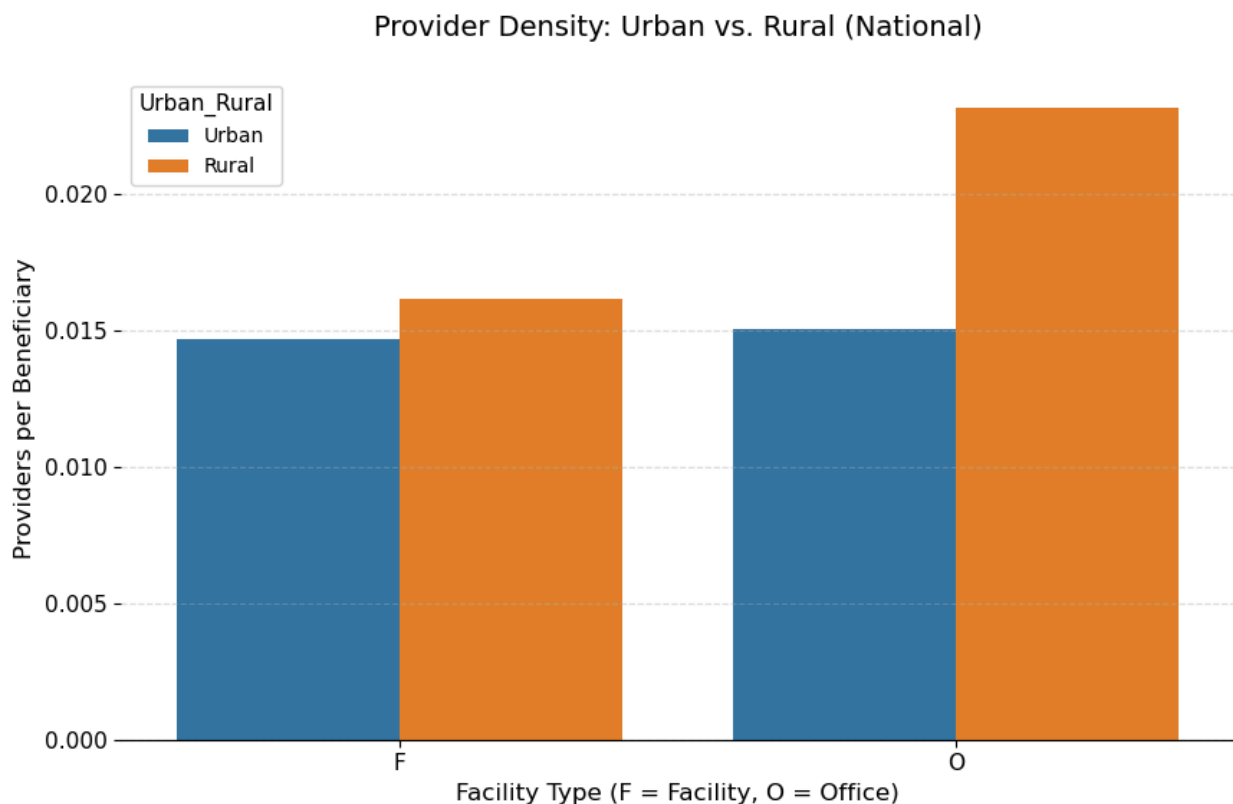

Provider Density Analysis:

1) National Provider Density (Provider_Density):

Average number of providers per patient.

$$\text{Provider_Density_Per_Day} = \text{Unique_Providers} / \text{Total_Beneficiaries}$$

Highlights how dispersed or concentrated access to care is, lower coverage can indicate underserved areas.

2) National Provider Density (Provider_Density_Per_Day):

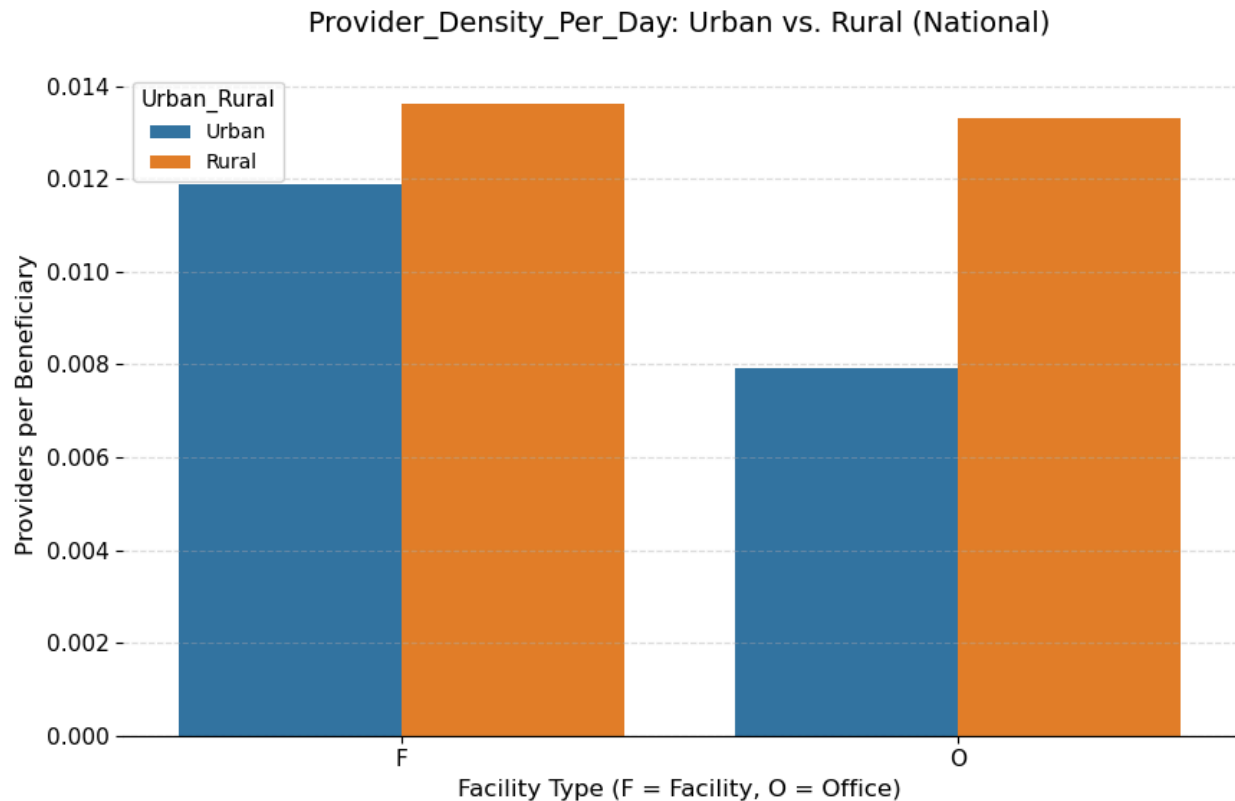

Average number of providers available per beneficiary treatment-day based on facilities and urban-rural labels.

$$\text{Provider_Density_Per_Day} = \text{Unique_Providers} / \text{Total_Beneficiary_Days}$$

Quantifies availability of providers relative to daily service demand, low values may signal high workload per provider.

So in Urban areas we see that the provider density is actually less thus we need more providers in Urban areas than rural and the situation in rural areas is better especially in case of facilities.

Rural areas might show higher density only because there are fewer patients overall. This does not mean rural areas have better access, only that providers there are not overburdened when present.

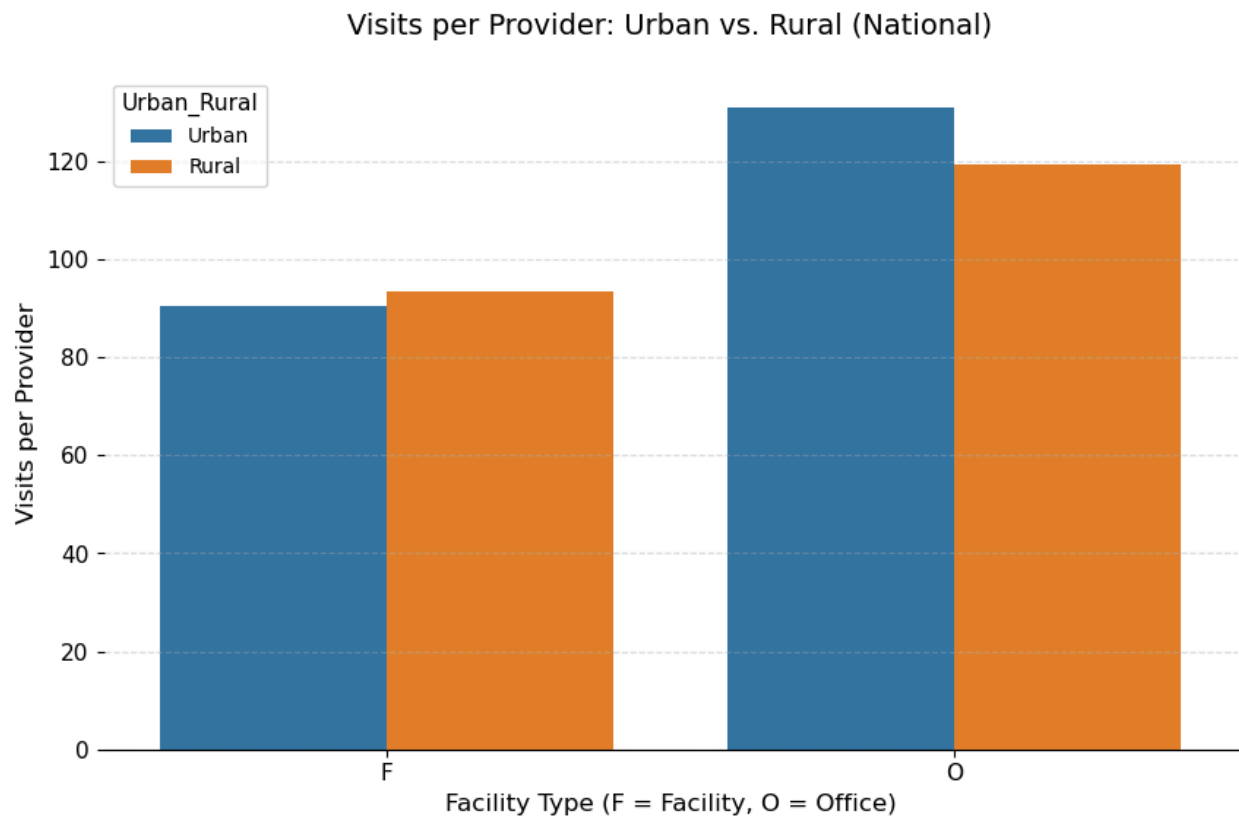

4) Annual Visit-Days per Provider

This metric reflects how many RFA-related visits (beneficiary service days) each provider is handling, averaged across urban and rural areas by facility type.

$$\text{Visits_per_Provider} = \text{Total_Beneficiary_Days} / \text{Unique_Providers}$$

Urban office-based providers see the highest volume, suggesting potential provider strain in high-demand outpatient settings. In contrast, rural offices have slightly lower volumes, while facility-based providers (urban and rural) see more balanced levels.

While rural areas often appear better on availability metrics, this utilization metric gives additional insight into care intensity.

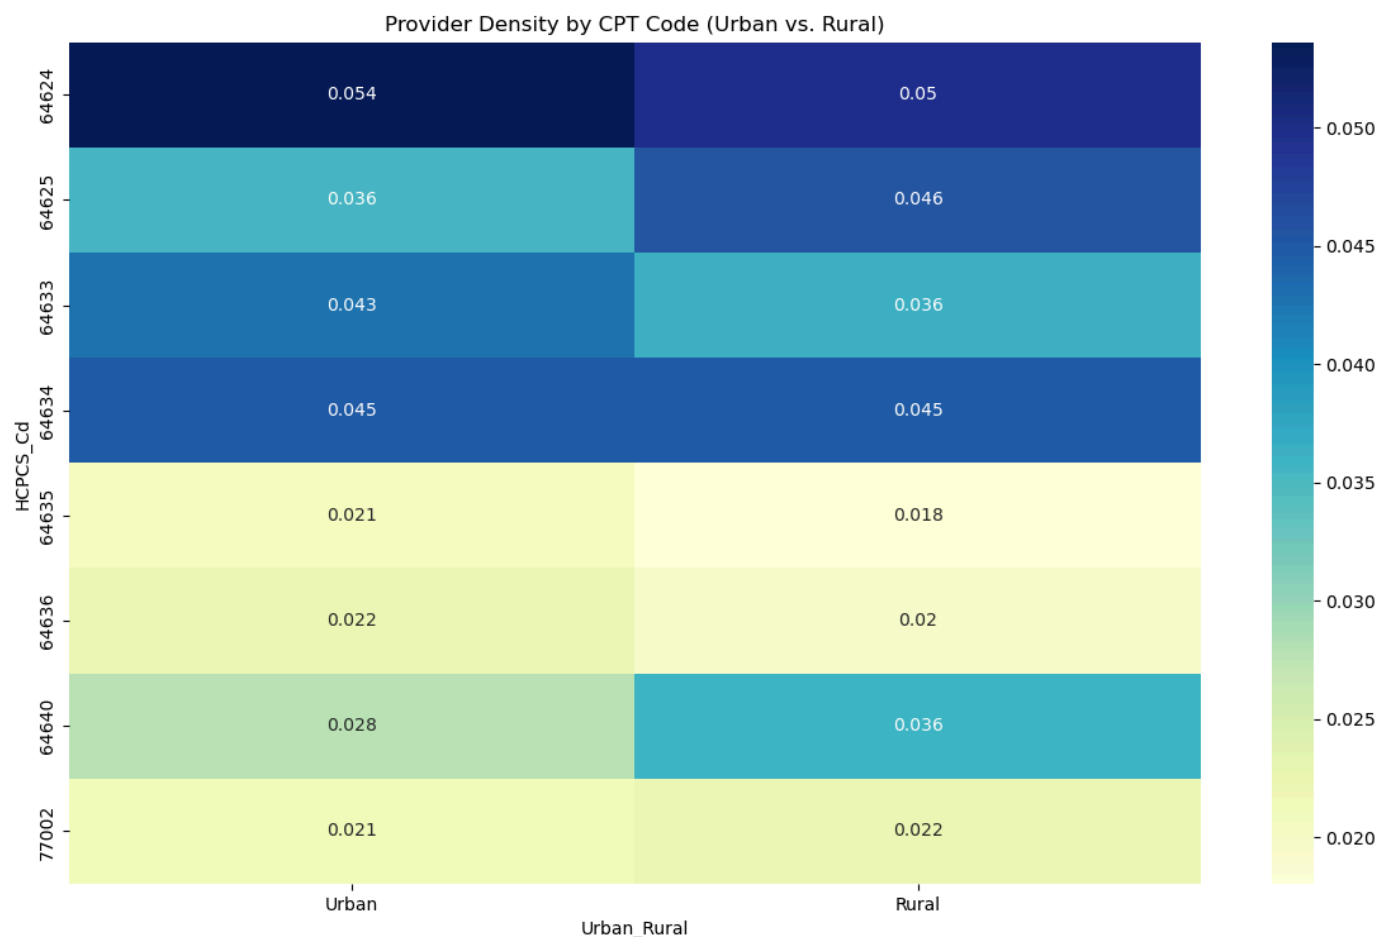

5) Provider Density by CPT Code and Geography:

To understand how access to radiofrequency ablation (RFA) services varies by setting, we analyzed provider density across the top 5 most utilized CPT codes based on Medicare Fee-for-Service (FFS) beneficiary counts.

Provider Density = Unique Providers / Total Beneficiaries

(Higher values = more providers per patient = potentially better access)

We then segmented this by urban and rural categorization:

For CPT 64635 (lumbar/sacral RFA) and 64636, urban and rural densities are fairly aligned — suggesting broad reach of this core procedure.

CPT 64624 (genicular nerve ablation) shows highest density in both urban and rural — possibly due to broader adoption in outpatient knee pain management.

Notably, 64640 (other peripheral nerves) shows higher density in rural settings, which may signal localized chronic pain care being managed more frequently in rural clinics.

6)State-Level Disparities in Provider Density: Urban vs Rural

To identify geographic disparities in access to Radiofrequency Ablation (RFA) treatment, we analyzed provider density gaps between urban and rural areas across all U.S. states, separately for facility-based and office-based care.

Provider Density = Unique Providers / Total Beneficiary Days

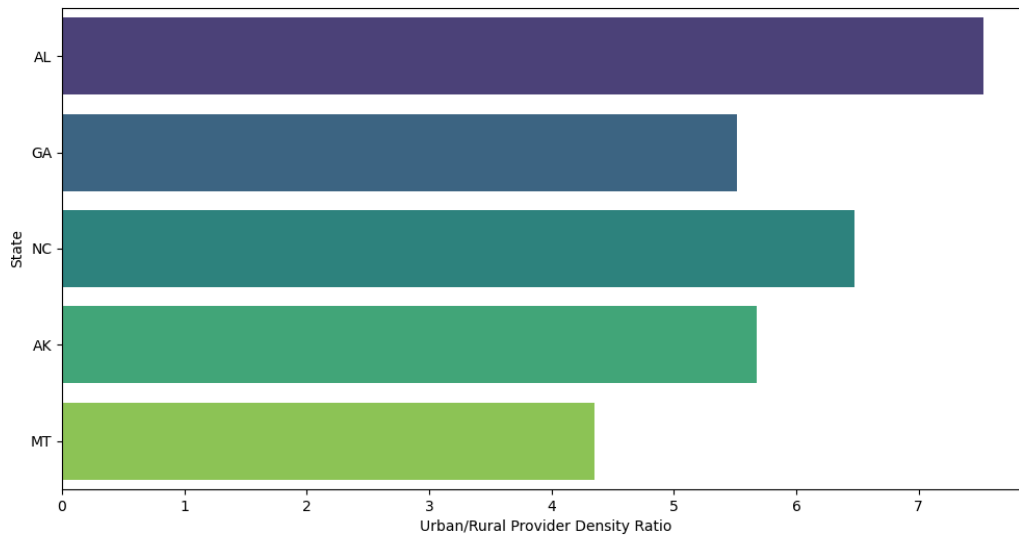

Then grouped the data by: **State, Place of Service** (Facility “F” or Non-Facility “O”), **RUCA classification** mapped to "Urban" or "Rural"

Next, we computed a **gap ratio** per state:

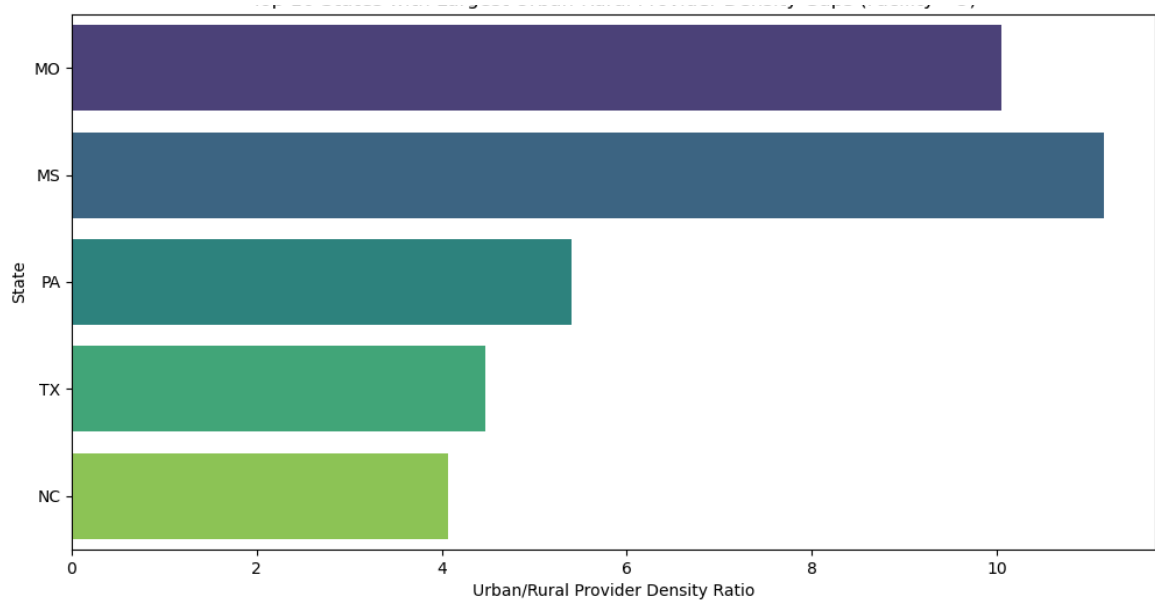

$$\text{Urban-Rural Gap Ratio} = \text{Urban Provider Density} / \text{Rural Provider Density}$$

A **higher ratio** means urban areas have **much greater provider availability** compared to rural areas — a red flag for potential rural access challenges.

Top 5 states with the largest Urban - Rural Provider Density Gaps (Facility - F)

Top 5 states with the largest Urban - Rural Provider Density Gaps (Facility - O)

High Urban-Rural Disparity States (MO, MS, PA, TX, NC)

Missouri (MO) and **Mississippi (MS)** lead with gap ratios over **10x**, indicating urban areas have more than 10 times the provider density of rural areas.

Pennsylvania (PA), **Texas (TX)**, and **North Carolina (NC)** follow with ratios between **4x** and **6x**.

Top States by Gap Ratio:

- **Alabama (AL)** tops the list with a **~7.5x** disparity.
- **Georgia (GA)**, **North Carolina (again!)**, **Alaska (AK)**, and **Montana (MT)** also show high gaps, from **4x** to **6.5x**.

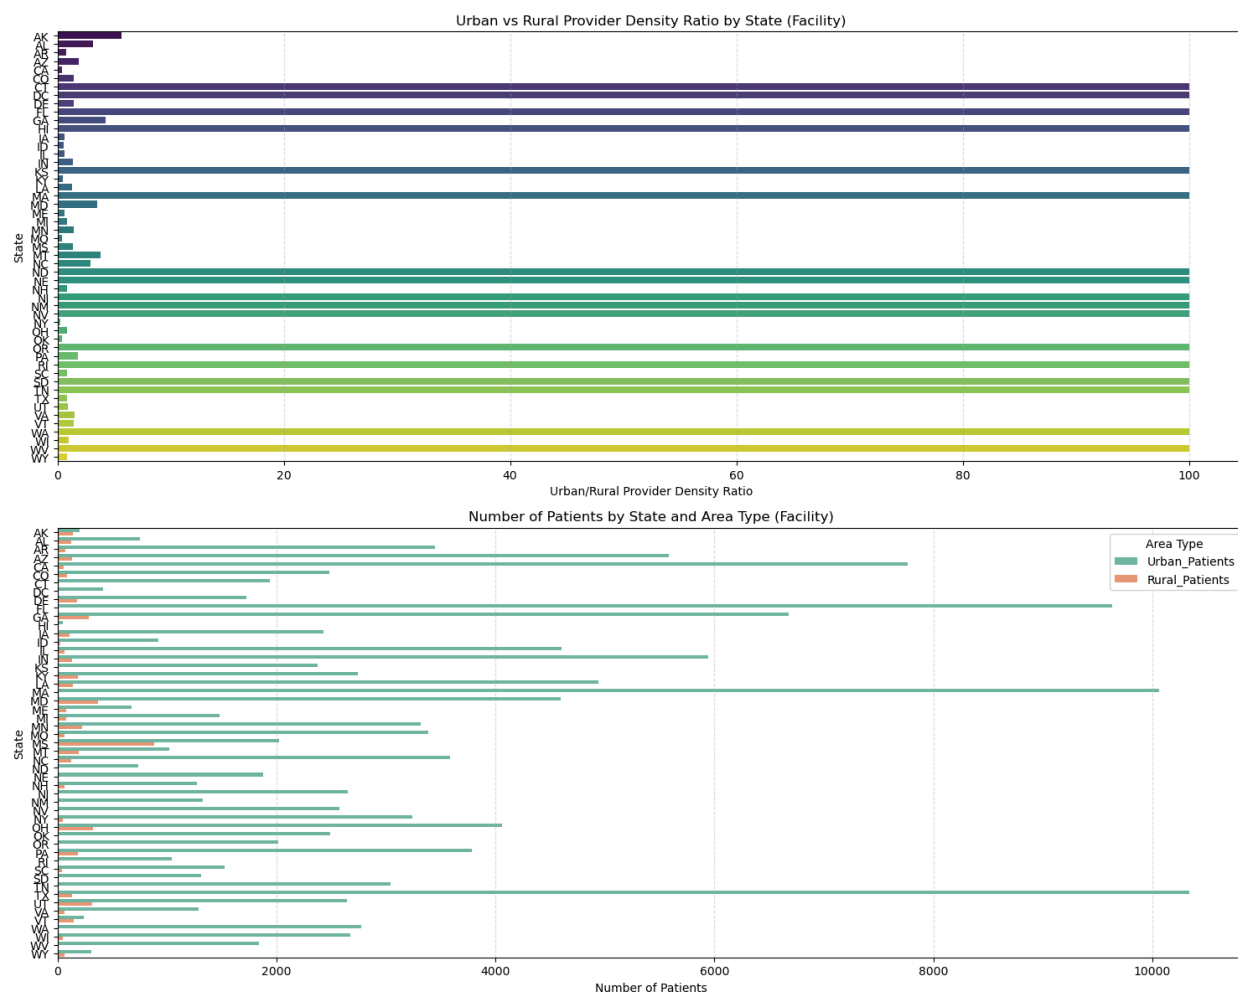

State-Level Analysis and Interpretation:

Urban vs Rural Provider Density Ratio by State (Facility):

- Depicts the Urban/Rural provider density ratio for every state. If the state is entirely urban (for the data we have), or at least, there are no rural records in your dataset for that state and facility type then the ratio is 100.
- Higher values = worse rural access relative to urban.
- Alaska (AK), Missouri (MO), Mississippi (MS) have ratios above 5, indicating serious rural access challenges.

Number of Patients by State and Area Type (Facility)

- Shows the raw patient counts for urban vs. rural areas in each state.
- MO, TX, and CA have high urban patient volumes, while rural volumes stay low across the board.
- In MS, although rural patients are relatively more present, their provider coverage is disproportionately low.

7) Drug-Related Service Analysis:

RFA CPT/HCPSC codes typically do not include drug administration directly.

Opioid prescriptions are often billed separately, especially under pharmacy claims or outside the Part B Fee-for-Service scope.

Drug Services Are Statistically Absent:

Across all states and service settings (Facility and Office), the percentage of claims flagged as involving drug services was near **0%**, both in urban and rural areas. This is confirmed by:

- The “**Percentage of Drug-Related Services by State and Area Type**” chart, where all bars are essentially flat at zero.
- The **summary statistics** shows that **Drug_Service_Pct** has a mean and standard deviation of 0.0 across all regions.

Urban_Rural	Place_Of_Srv_c	Drug_Service_Pct	Drug_Service_Pct	Drug_Service_Pct	Drug_Service_Pct	Provider_Density	Provider_Density	Provider_Density	Provider_Density	Total_Services	Drug_Services

Medicare Part D Opioid Prescribing Mapping Tool analysis:

About the dataset:

The Medicare Part D Opioid Prescribing Mapping Tool provides state-, county-, and ZIP-level insights into opioid prescribing rates among Medicare beneficiaries. The data reflect claims from health care providers who prescribed medications covered under Medicare Part D and are released annually by CMS.

Key Variables Used in This Analysis:

Column	Description
Prscrbr_Geo_Desc	Name of the geographic region (e.g., "California")
Breakout_Type / Breakout	Used to distinguish data by population type (e.g., Urban, Rural, or Overall)
Opioid_Prscrbrng_Rate	% of total Medicare Part D claims that were opioid-related
Tot_Prscrbrs / Tot_Opioid_Clms	Total prescribers and opioid-related claims
LA_Opioid_Prscrbrng_Rate	Prescribing rate specific to long-acting opioids

Opioid_Prscrbing_Rate_1Y_Chg, 5Y_Chg One-year and five-year percentage point change in opioid prescribing

Data are aggregated at the prescriber ZIP-code level, then assigned to geographic units using RUCA codes and HUD crosswalks to define rural/urban status

Limitations:

1. Privacy-Driven Data Suppression:

All opioid claim counts between 1–10 are suppressed to protect beneficiary privacy. When one group (e.g., rural) is suppressed, the complementary group (e.g., urban) may also be secondarily suppressed to prevent inference. This may affect state-level totals and comparisons between rural/urban slices.

2. No Clinical Appropriateness or Diagnosis Context: The dataset does not distinguish between: opioid use for cancer or palliative care (which may be appropriate), Opioid use for chronic non-cancer pain (which is the target of intervention) It also does not capture the diagnosis, indication, or outcome of the prescription.

3. Prescription ≠ Use: The data reflects filled prescriptions, not actual drug consumption. There's no insight into whether patients took the medication as prescribed or at all.

4. Excludes Medicare Advantage and Commercial Insurance: Only includes Medicare Fee-for-Service Part D beneficiaries. Medicare Advantage plans and private payers are excluded, which may skew totals in younger or urban populations.

5. Annual Crosswalk Precision: ZIPs are assigned to counties and RUCA zones based on HUD crosswalks, which update quarterly. If a ZIP spans multiple counties or zones, the most frequent association is used—introducing some geocoding imprecision, especially in border regions.

Plots:

Plot 1: Top 10 States by Rural–Urban Opioid Prescribing Gap

Rural_Urban_Gap = Opioid_Prscrbrng_Rate_Rural - Opioid_Prscrbrng_Rate_Urban

The chart highlights the **top 10 U.S. states** with the largest **rural-over-urban opioid prescribing gaps** among Medicare beneficiaries. In **New Jersey, California, and Hawaii**, rural areas prescribed opioids at rates **1.2–2.1 percentage points higher** than their urban counterparts.

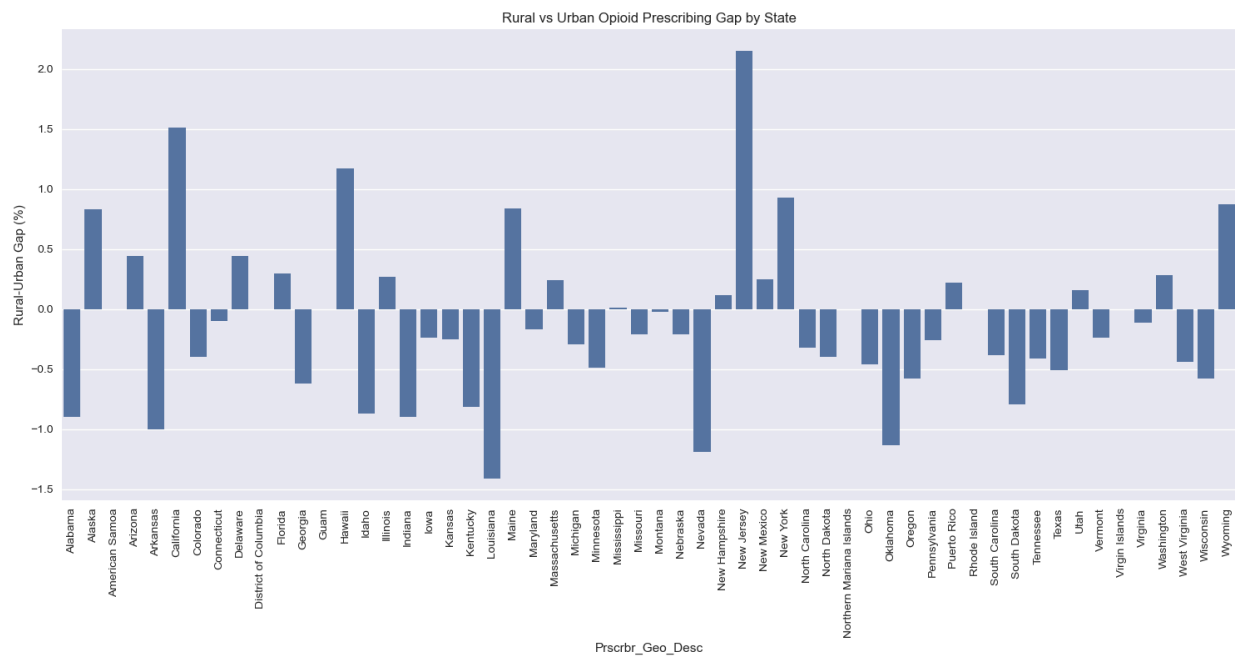

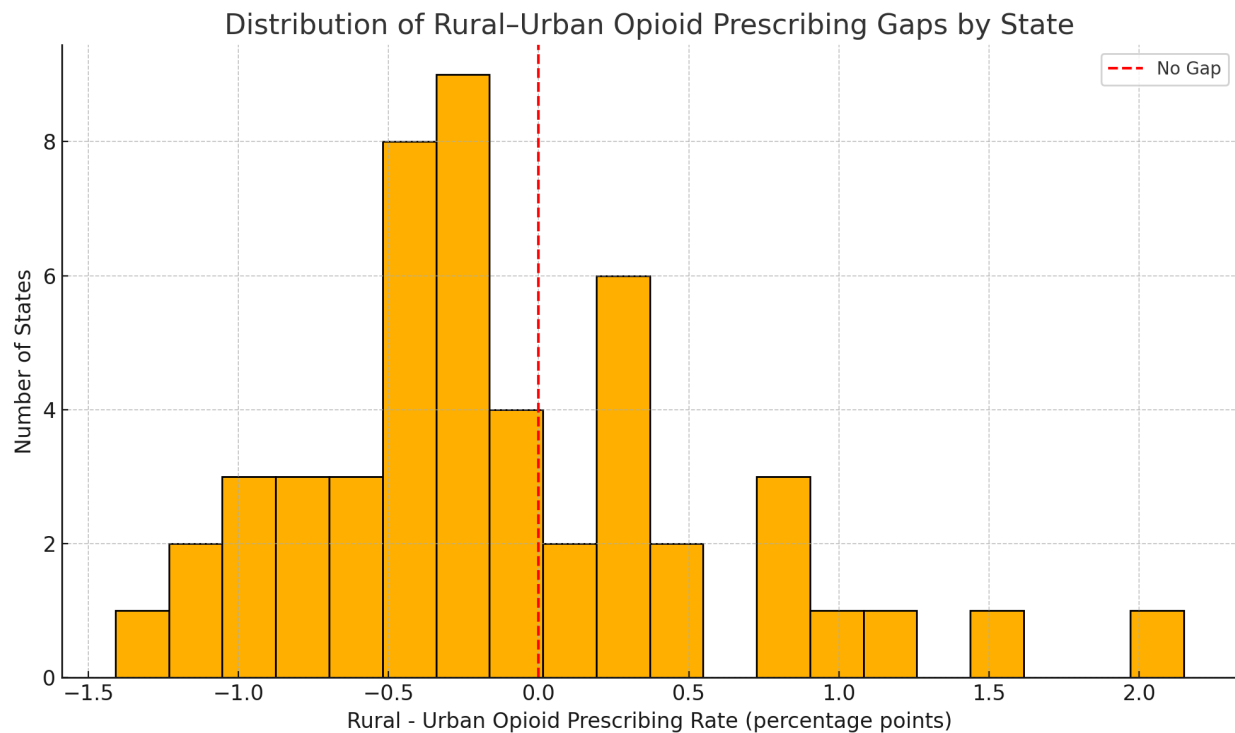

This differential prescribing suggests that rural providers may be **compensating for limited access to interventional treatments**—such as radiofrequency ablation (RFA)—with pharmacologic approaches. The data strengthens the case for **deploying non-opioid pain alternatives** like Nervida RF in rural health systems where access gaps may drive unintended opioid reliance.

Urban areas, on average, prescribe opioids at slightly higher rates (4.12%) than rural areas (4.00%).

In 32 states, urban prescribing exceeds rural rates.

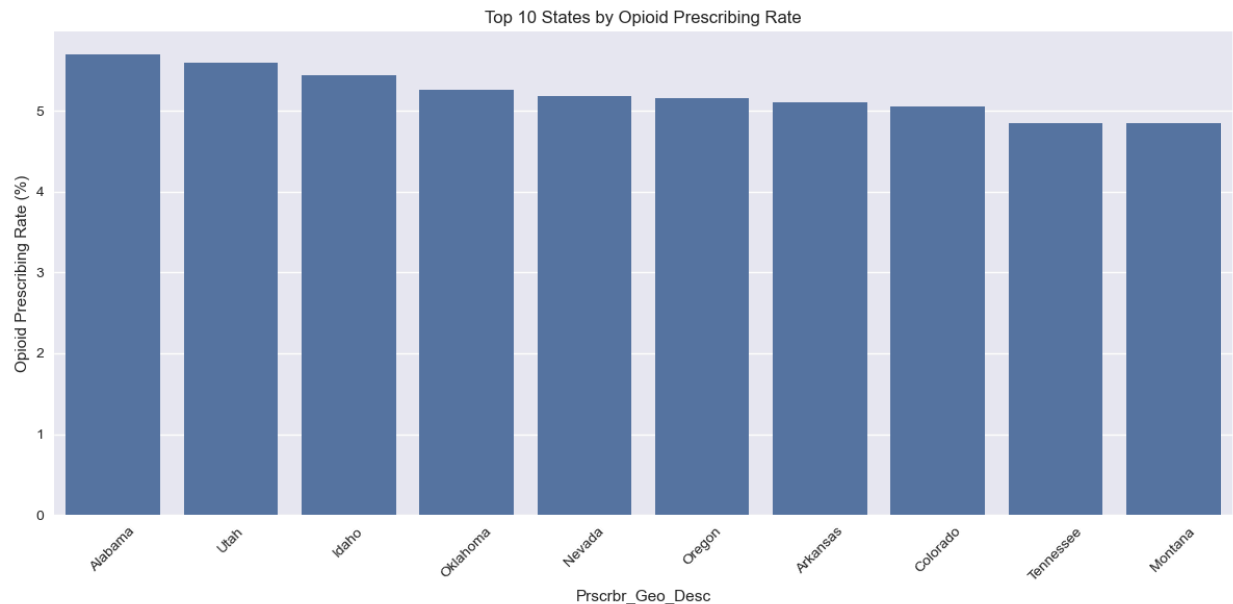

In 18 states, rural prescribing is higher.

New Jersey stands out with the largest rural-over-urban gap (~+2.15 pp). Arkansas, Louisiana, Oklahoma, Nevada, and others show substantial urban-over-rural prescribing gaps (negative values). Many states hover around 0, indicating little or no difference in opioid prescribing behavior by geography.

Plot 2: Top 10 States by Overall Opioid Prescribing Rate

States like Alabama, Utah, Idaho lead in total prescribing — ranging from 5.6% down to ~4.9%. Notably, Alabama and Arkansas, which show high opioid use, also appeared in your earlier RFA access gap charts — reinforcing concern about overreliance on pharmacologic care.

Possible Conclusions:

1. Association Between RFA Access Gaps and Opioid Use

States with high urban-rural disparities in RFA provider access—such as California, New Jersey, and Alabama—also appear in the top ranks for opioid prescribing rates or rural-urban opioid gaps.

While this does not prove direct causation, the pattern suggests that limited interventional access in rural regions may be associated with greater reliance on pharmacologic pain management. This observation warrants

deeper investigation, potentially using longitudinal opioid prescribing and RFA utilization data at the county level.

State	Opioid Rx Rate - Rural (%)	Opioid Rx Rate - Urban (%)	Rural-Urban Gap (pp)	RFA Patients per Provider - Urban	RFA Patients per Provider - Rural	Urban-Rural Gap Ratio
California	5.15	3.64	1.51	72.7	18.3	~4x
Alabama	4.96	5.86	-0.9	55.1	98.0	~7.5x

2. Urban Provider Strain is Higher Despite More Patients

Contrary to typical assumptions, the RFA provider density (per patient and per visit-day) is often lower in urban areas—especially in office settings

This is likely because urban areas treat a significantly larger volume of patients, concentrating demand in fewer high-volume practices. As a result, urban providers may be more strained, even if rural areas have higher geographic access barriers.

3. Rural Density Metrics Can Be Misleading

While some rural areas show higher provider density (i.e., more providers per beneficiary), this often reflects very small rural patient populations, not necessarily better access.

For example, Alaska and Mississippi show large rural-urban gaps in provider counts, but rural patients are served by just 1 or 2 providers, indicating vulnerability to provider shortages.

Appendix: State-Level Disparity Table - RFA

A full appendix for each U.S. state and place-of-service type (Facility vs Office):
